1 Introduction

1.1 Overview

Note that this specification will be the standard specification to be used for complex options on the Cboe EDGX and C2 Options Exchange platforms.

Cboe customers may use Complex Multicast PITCH to receive real-time depth of book quotations and execution information direct from Cboe. This feed will only include quotations and executions related to complex orders.

Complex Multicast PITCH cannot be used to enter orders. For order entry, refer to the appropriate US Options FIX or BOE Specifications.

A Gig-Shaped version of the Complex Multicast PITCH feed is available from both of Cboe's datacenters. Customers may choose to take one or more of the following Complex Multicast PITCH feed options depending on their location and connectivity to Cboe.

Complex Multicast PITCH Feed Descriptions:

Exchange	Shaping (Gig)	Served From Data Center (Primary/Secondary)	Multicast Feed ID
EDGX Options	Gig	Primary	EAC
EDGX Options	Gig	Primary	EBC
EDGX Options	Gig	Secondary	EEC
C2 Options	Gig	Primary	WAC
C2 Options	Gig	Primary	WBC
C2 Options	Gig	Secondary	WEC

1.2 Feed Connectivity Requirements

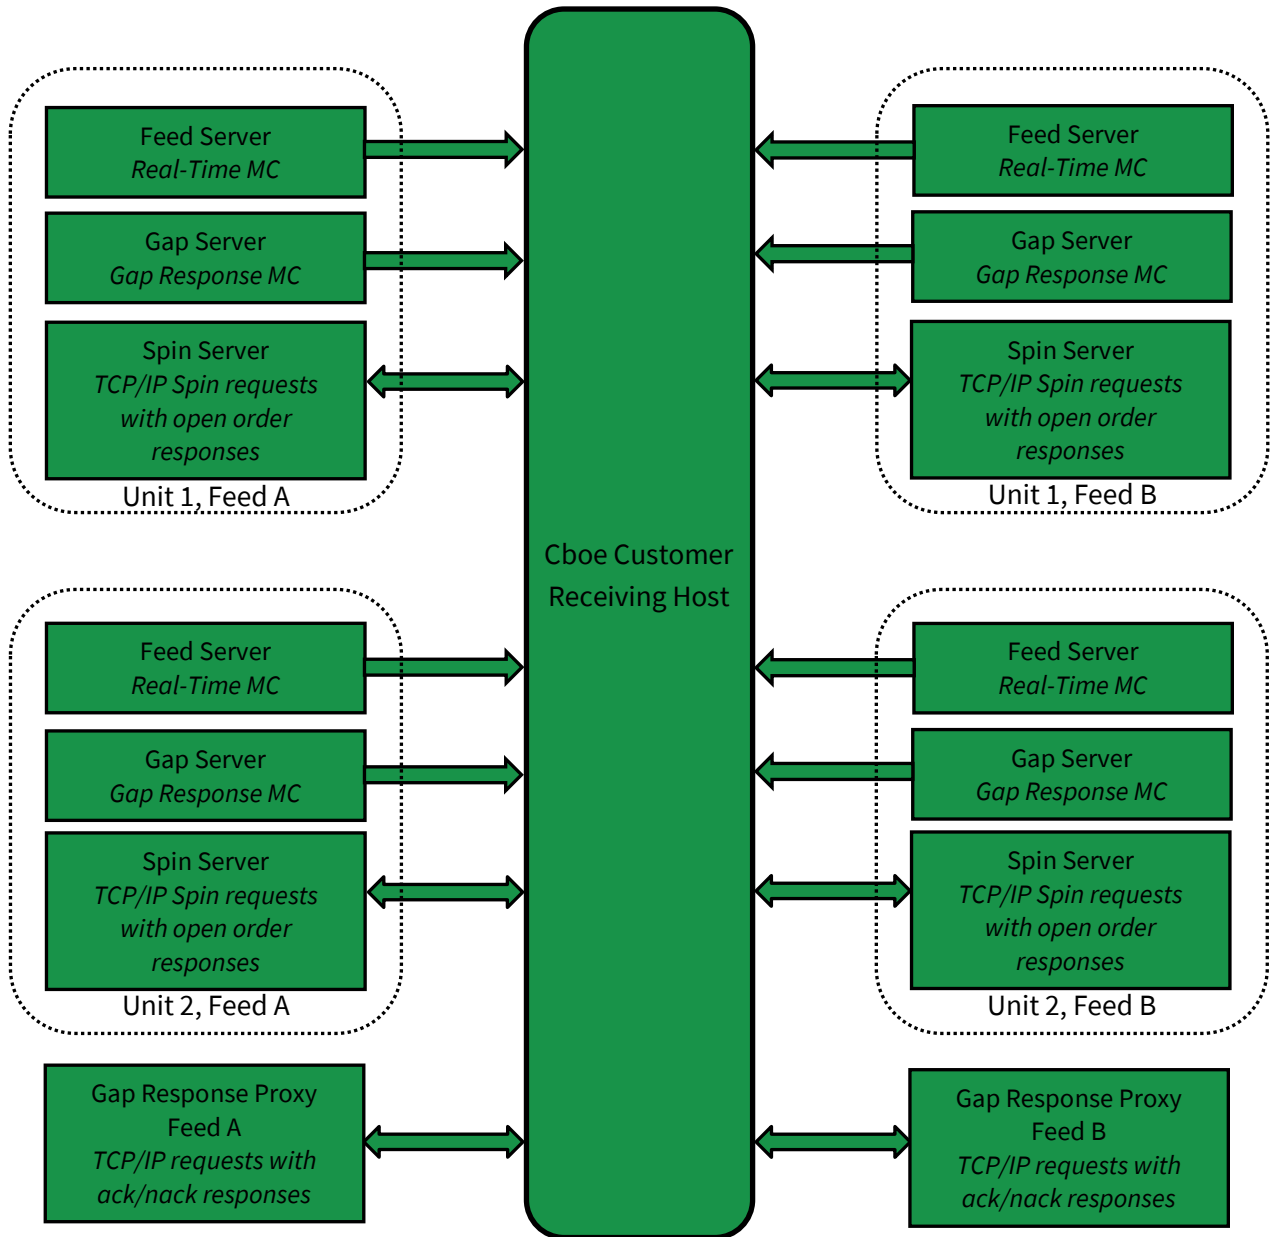

Gig Shaped feeds are available to customers with a minimum of 1 Gb/s of connectivity to Cboe via cross connect or dedicated circuit.

Customers with sufficient connectivity may choose to take more than one Gig-Shaped feed from the Cboe datacenters and arbitrate the feeds to recover lost data. It should be noted that feeds from the secondary datacenter will have additional latency for those co-located with Cboe in the primary datacenter due to proximity.

Cboe Complex Multicast PITCH real-time events are delivered using a published range of multicast addresses divided by symbol range units. Dropped messages can be requested using a TCP/IP connection to one of Cboe's Gap Request Proxy ("GRP") servers with replayed messages being delivered on a separate set of multicast ranges reserved for packet retransmission. Intraday, a spin of all open orders may be requested from a Spin Server. This allows a client to become current without requesting a gap for all messages up to that point in the day.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

The following diagram is a logical representation Complex Multicast PITCH feed message flow between Cboe and a customer feed handler that is listening to the “A” and “B” instances of two units:

1.3 Symbol Ranges, Units, and Sequence Numbers

Symbols will be separated by OSI root into units by a [published alphabetical distribution](#). Symbol distribution will not change intra-day. Cboe does, however, **reserve the right to add multicast addresses or change the symbol distribution** with prior notice to customers. Care should be taken to ensure that address changes, address additions, and symbol distribution changes can be supported easily.

Message sequence numbers are incremented by one for every sequenced message within a particular symbol unit. It is important to understand that one *or more* units will be delivered on a single multicast address. As with symbol ranges, unit distribution across multicast addresses will not change intra-day, but may change after notice has been given.

Symbol distribution across units as well as unit distribution across multicast addresses are identical for real-time and gap response multicast addresses.

1.4 Complex Options Specific Symbol Processing

Cboe has implemented a Complex Instrument Creation (“CIC”) process due to the seemingly infinite number of combinations that can make up a complex instrument. This allows the Complex Multicast PITCH specification to be consistent with the equities, standard and auction options Multicast PITCH specifications. This CIC process significantly reduces the size of the Complex Multicast PITCH feed and allows customers to use the same feed handler for Cboe equity, options, and futures exchanges.

Real-time CIC messages are available on each unit’s multicast feed. `Complex Instrument Definition` messages are used to map the 6 character feed Complex Instrument ID (“CID”) to the complex instrument definition. A complex instrument definition consists of two or more option legs. **The complex instrument is valid only for the current trading date on which it was created.** `Complex Instrument Definition` messages are sequenced messages and can be sent from pre-market through the end of trading. Once a complex instrument is created, it cannot be deleted or modified for the remainder of the trading day.

1.5 Gap Request Proxy and Message Retransmission

Requesting delivery of missed data is achieved by connecting to the Cboe Gap Request Proxy (“GRP”) for the complex options data feed. Customers who do not wish to request missed messages do not need to connect to a GRP for any reason or listen to the multicast addresses reserved for message retransmission. Customers choosing to request missed data will need to connect to their assigned GRP, log in, and request gap ranges as necessary. All gap requests will be responded to with a `Gap Response` message. A `Gap Response Status` code of `Accepted` signals that the replayed messages will be delivered via the appropriate gap response multicast address. Any other `Gap Response Status` code will indicate the reason that the request cannot be serviced.

Gap requests are limited in message count, frequency, and age by the GRP. Gap requests will only be serviced if they are within a defined sequence range of the current multicast sequence number for the

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

requested unit. Customers will receive a total daily allowance of gap requested messages. In addition, each customer is given renewable one second and one minute gap request limits.

If more than one gap request is received for a particular unit/sequence/count combination within a short timeframe, all requests will receive a successful `Gap Response` message from the GRP, but only a single replayed message will be sent on the gap response multicast address.

If overlapping gap requests are received within a short period of time, the gap server will only send the union of the sequence ranges across grouped gap requests. Customers will receive gap responses for their requested unit/sequence/count, but receivers should be prepared for the **gap responses to be delivered via multicast in non-contiguous blocks**.

Gap acknowledgements or rejects will be delivered to users for every gap request received by the GRP. Users should be prepared to see replayed multicast data before or after the receipt of the gap response acknowledgement from the GRP.

1.6 Spin Servers

A Spin Server is available for each unit. The server allows customers to connect via TCP and receive a spin of all complex instrument definitions and currently open orders with limited trading conditions on that unit. By using the spin, a customer can get the current complex book quickly in the middle of the trading session without worry of gap request limits. The Spin Server for each unit listens on its own address and/or TCP port.

Upon successful login and periodically thereafter, a `Spin Image Available` message is sent which contains a sequence number indicating the most recent message applied to the complex book. Using a `Spin Request` message, a customer may request a spin for the orders up to a sequence number noted within one of the last ten `Spin Image Available` messages distributed. If the `Spin Request` submitted does not present a sequence number that matches one of the last ten `Spin Image Available` messages distributed, the spin will return orders up to the next closest sequence number reported through a `Spin Image Available` message that is greater than the sequence number requested.

In the case a customer sends a sequence number in a `Spin Request` that is higher than the sequence number reported by the most recent `Spin Image Available` message, the next spin image to be generated will be returned when it is available. If the requested sequence number is still higher at that time, an "O" (Out of Range) error will be generated.

A spin consists only of `Complex Instrument Definition`, `Add Order` (long and/or short), `Trading Status` and `Time` messages. `Trading Status` messages will be sent in spins for all complex instruments that are not "S"uspended, which results in at least two messages for every complex instrument that has not been "S"uspended since system startup. Spins will not contain any message for an order which is no longer on the book. While receiving the spin, the customer must buffer

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

multicast messages received. If the `Spin Image Available` message sequence number is the customer's reference point, multicast messages with larger sequence numbers should be buffered. If a non-`Spin Image Available` sequence number is the customer's reference point from which they send in their `Spin Request`, they should buffer from that point on, but note that the spin they will receive will contain sequence numbers beyond that point which may be disregarded. When a `Spin Finished` message is received, the buffered messages must be applied to spun copy of the book to bring it current.

[Section 5.7](#) shows an example flow of messages between a customer and Cboe's Multicast PITCH feed and Spin Server.

2 Protocol

Cboe users may use the PITCH 2.X protocol over multicast to receive real-time full depth of complex book quotations and execution information direct from Cboe.

PITCH 2.X cannot be used to enter orders. For order entry, refer to the appropriate US Options FIX or BOE Specifications.

All visible orders and executions are reflected via the PITCH 2.X feed. All orders and executions are anonymous, and do not contain any customer identity.

2.1 Message Format

The messages that make up the PITCH 2.X protocol are delivered using *Sequenced Unit Header* which handles sequencing and delivery integrity. All messages delivered via multicast as well as to/from the Gap Request Proxy (GRP) will use the *Sequenced Unit Header* for handling message integrity.

All UDP delivered events will be self-contained. Developers can assume that UDP delivered data will not cross frame boundaries and a single Ethernet frame will contain only one *Sequenced Unit Header* with associated data.

TCP/IP delivered events from the GRP may cross frames as the data will be delivered as a stream of data with the TCP/IP stack controlling Ethernet framing.

The PITCH data feed is comprised of a series of dynamic length sequenced messages. Each message begins with *Length* and *Message Type* fields. **Cboe reserves the right to add message types and grow the length** of any message without notice. Customers should develop their decoders to deal with unknown message types and messages that grow beyond the expected length. Messages will only be grown to add additional data to the end of a message.

2.2 Data Types

The following field types are used within the `Sequenced Unit Header`, GRP messages, and PITCH 2.X.

- **Alphanumeric** fields are left justified ASCII fields and space padded on the right.
- **Binary** fields are unsigned and sized to “Length” bytes and ordered using Little Endian convention (least significant byte first).
- **Signed Binary** fields are signed and sized to “Length” bytes and ordered using Little Endian convention (least significant byte first).
- **Binary Signed Short Price** fields are signed Little Endian encoded 2 byte binary fields with 2 implied decimal places (denominator = 100). The short price range is -327.68 to +327.67. Prices outside of this range will use the long price.
- **Binary Signed Long Price** fields are signed Little Endian encoded 8 byte binary fields with 4 implied decimal places (denominator = 10,000).
- **Bit Field** fields are fixed width fields with each bit representing a boolean flag (the 0 bit is the lowest significant bit; the 7 bit is the highest significant bit).
- **Printable ASCII** fields are left justified ASCII fields that are space padded on the right that may include ASCII values in the range of 0x20 – 0x7e.

2.3 Message Framing

Depth of book update messages will be combined into single UDP frame where possible to decrease message overhead and total bandwidth. The count of messages in a UDP frame will be communicated using the `Sequenced Unit Header`. Framing will be determined by the server for each unit and site. The content of the multicast across feeds (e.g. A/B & Gig-Shaped) will be identical, **but framing will not be consistent across feeds**. Receiving processes that receive and arbitrate multiple feeds cannot use frame level arbitration to fill gaps.

2.4 Sequenced Unit Header

The `Sequence Unit Header` is used for all Cboe Complex Multicast PITCH messages as well as messages to and from the Gap Request Proxy (“GRP”) and Spin Servers.

Sequenced and un-sequenced data may be delivered using the `Sequenced Unit Header`. Un-sequenced headers will have a 0 value for the sequence field and potentially for the unit field. All messages sent to and from the GRP and Spin Server are un-sequenced while multicast may contain sequenced and un-sequenced messages.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Sequenced messages have implied sequences with the first message having the sequence number contained in the header. Each subsequent message will have an implied sequence one greater than the previous message up to a maximum of count messages. Multiple messages can follow a *Sequenced Unit Header*, but a combination of sequenced and un-sequenced messages cannot be sent with one header.

The sequence number for the first message in the next frame can be calculated by adding the *Hdr Count* field to the *Hdr Sequence*. This technique will work for sequenced messages and heartbeats.

Sequenced Unit Header				
Field	Offset	Length	Value/Type	Description
Hdr Length	0	2	Binary	Length of entire block of messages. Includes this header and <i>Hdr Count</i> messages to follow.
Hdr Count	2	1	Binary	Number of messages to follow this header.
Hdr Unit	3	1	Binary	Unit that applies to messages included in this header.
Hdr Sequence	4	4	Binary	Sequence of first message to follow this header.
Total Length = 8 bytes				

2.5 Execution IDs

The 1st character of an *Execution ID* (after converting to a 9 character, base 36 number, zero-padded on the left) may be used to differentiate between internal matched trades and internal auction fills as follows:

- 0 (zero) = Cboe Internal Match
- C = Auction Fill

2.6 Heartbeat Messages

The *Sequenced Unit Header* with a count field set to “0” will be used for *Heartbeat* messages. During trading hours *Heartbeat* messages will be sent from the GRP and all multicast addresses if no data has been delivered within 1 second. *Heartbeat* messages never increment the sequence number for a unit, but can be used to detect gaps on the real-time multicast channels during low update rate periods.

Heartbeats on the real-time multicast addresses during trading hours will have a *Hdr Sequence* value equal to the sequence of the next sequenced message to be sent for the unit. *Heartbeats* on gap multicast addresses will always have the *Hdr Sequence* field set to 0. All *Heartbeat* messages sent to and from the GRP are considered un-sequenced and should have sequence and unit fields set to 0.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Outside of trading hours Cboe sends `Heartbeat` messages on all real-time and gap channels with a sequence of "0" to help users validate multicast connectivity. `Heartbeat` messages may not be sent from 12:00 am – 1:00 am ET or during maintenance windows.

Cboe expects `Heartbeat` messages to be sent to the GRP on live connections no less than every 5 seconds. Failure to receive 2 consecutive `Heartbeat` messages will result in the GRP terminating the client connection.

3 PITCH 2.X Messages

With the exception of `Time`, `Trading Status`, and `Complex Instrument Definition` messages, each PITCH message reflects the addition, deletion, modification, or execution of an order in the system.

3.1 Time

A `Time` message is sent whenever the source time for a unit passes over a second boundary. All subsequent time offset fields for the same unit will use the new `Time` value as the base until another `Time` message is received for the same unit.

Time				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x20	Time Message
Time	2	4	Binary	Number of whole seconds from midnight Eastern Time
Total Length = 6 bytes				

3.2 Unit Clear

The `Unit Clear` message instructs feed recipients to clear all orders for the Cboe complex book in the unit specified in the `Sequenced Unit Header`. This message will be sent at startup each day. It would also be distributed in certain recovery events such as a data center fail-over.

Unit Clear				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x97	Unit Clear Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Total Length = 6 bytes				

3.3 Complex Instrument Definition

A `Complex Instrument Definition` message represents a complex instrument that is available to place orders. It is sent as a sequenced message.

The `Complex Instrument Definition` message will contain two or more repeating groups of leg definitions. There is a limit of 12 leg definitions.

The `Leg Offset` field is provided to support adding additional fields to this message between the offset field and the Leg definitions. A `Leg Offset` of 1 means the leg definitions begin immediately following the `Leg Offset` field.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Complex Instrument Definition				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x99	Complex Instrument Definition Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Complex Instrument Id	6	6	Printable ASCII	Complex Instrument Id right padded with spaces
Leg Count	12	1	Binary	The number of legs in this complex instrument
Leg Offset	13	1	Binary	Leg definitions begin this many bytes past this field
The following fields repeat <i>Leg Count</i> times (maximum of 12) for multi-leg strategies.				
Leg Ratio	13 + Leg Offset + (10 * Leg Index)	4	Signed Binary	Leg ratio (positive for buy-side, negative for sell-side)
Leg Symbol	13 + Leg Offset + (10 * Leg Index)	6	Printable ASCII	Option Symbol of leg right padded with spaces
Total Length = 13 + Leg Offset + (Leg Count * 10) bytes				

3.4 Add Order

An `Add Order` message represents a newly accepted visible order on the Cboe complex book. It includes a day-specific Order Id assigned by Cboe to the complex order.

Add Order (long)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x21	Add Order Message (long)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	Day-specific identifier assigned to this order
Side Indicator	14	1	Alphanumeric	"B" = Buy Order "S" = Sell Order
Quantity	15	4	Binary	Instrument quantity added to the complex book (may be less than the number entered).
Complex Instrument Id	19	6	Printable ASCII	<i>Complex Instrument Id</i> right padded with spaces.
Price	25	8	Binary Signed Long Price	The limit order price
Reserved	33	1	Reserved	Reserved
Total Length = 34 bytes				

Add Order (short)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Message Type	1	1	0x22	Add Order Message (short)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	Day-specific identifier assigned to this order
Side Indicator	14	1	Alphanumeric	"B" = Buy Order "S" = Sell Order
Quantity	15	2	Binary	Instrument quantity being added to the complex book (may be less than the number entered).
Complex Instrument Id	17	6	Printable ASCII	Complex Instrument Id right padded with spaces.
Price	23	2	Binary Signed Short Price	The limit order price
Reserved	25	1	Reserved	Reserved
Total Length = 26 bytes				

Add Order (expanded)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x2F	Add Order Message (expanded)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	Day-specific identifier assigned to this order
Side Indicator	14	1	Alphanumeric	"B" = Buy Order "S" = Sell Order
Quantity	15	4	Binary	Instrument quantity being added to the complex book (may be less than the number entered).
Complex Instrument Id	19	8	Printable ASCII	Complex Instrument Id right padded with spaces.
Price	27	8	Binary Signed Long Price	The limit order price
Reserved	35	1	Reserved	Reserved
ParticipantID	36	4	Alphanumeric	<i>Optionally specified.</i> If specified the Executing Broker of firm attributed to this quote. Space filled otherwise.
Customer Indicator	40	1	Alphanumeric	"N" = Non-Customer "C" = Customer
Total Length = 41 bytes				

3.5 Order Modification Messages

Order Modification messages refer to an Order ID previously sent with an Add Order message. Multiple Order Modification messages may modify a single complex order and the effects are cumulative. Modify messages may update the size and/or the price of a complex order on the book. When the remaining size of a complex order reaches zero, the complex order is dead and should be removed from the book.

3.5.1 Order Executed

Order Executed messages are sent when a visible complex order on the Cboe complex book is executed in whole or in part. The execution price equals the limit order price found in the original Add Order message or the limit order price in the latest Modify Order message referencing the Order Id.

Note even if there are single leg to complex order executions, this feed will only contain the order execution for the complex order. Any single leg execution information is available on the standard PITCH feed.

Order Executed				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field
Message Type	1	1	0x23	Order Executed Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	Order Id of a previously sent Add Order message that was executed
Executed Quantity	14	4	Binary	Instrument quantity executed
Execution Id	18	8	Binary	Cboe generated day-unique execution identifier of this execution. Execution Id is also referenced in the Trade Break message
Total Length = 26 bytes				

3.5.2 Order Executed at Price/Size

Order Execution at Price/Size messages are sent when a complex order on the Cboe complex book is executed in whole or in part at a different price than the limit price on the original Add Order message or the limit order price in the latest Modify Order message referencing the Order Id. If the Remaining Quantity field contains a 0 the complex order should be completely removed from the complex book.

Order Execution at Price/Size messages may also be sent in the event the existing size for Order Id is not equal to Executed Quantity + Remaining Quantity. In this case the complex order should be prioritized the same as a new complex order.

Order Executed at Price/Size				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field
Message Type	1	1	0x24	Order Executed at Price/Size Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Order Id	6	8	Binary	<i>Order Id</i> of a previously sent Add Order message that was executed
Executed Quantity	14	4	Binary	Instrument quantity executed
Remaining Quantity	18	4	Binary	Number of contracts remaining after the execution
Execution Id	22	8	Binary	Cboe generated day-unique execution identifier of this execution. Execution Id is also referenced in the Trade Break message
Price	30	8	Binary Signed Long Price	The execution price of the order
Total Length = 38 bytes				

3.5.3 Reduce Size

Reduce Size messages are sent when a complex order on the Cboe complex book is partially reduced.

Reduce Size (long)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x25	Reduce Size Message (long)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	<i>Order Id</i> of a previously sent Add Order message that has been reduced
Canceled Quantity	14	4	Binary	Instrument quantity canceled
Total Length = 18 bytes				

Reduce Size (short)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x26	Reduce Size Message (short)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	<i>Order Id</i> of a previously sent Add Order message that has been reduced
Canceled Quantity	14	2	Binary	Instrument quantity canceled
Total Length = 16 bytes				

3.5.4 Modify Order

The Modify Order message is sent whenever an open complex order is visibly modified. The *Order Id* refers to the *Order Id* of the original Add Order message.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Note that `Modify Order` messages that appear to be “no ops” (i.e. they do not appear to modify any relevant fields) will still lose priority.

Modify (long)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x27	<code>Modify Order</code> Message (long)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	<i>Order Id</i> of a previously sent <code>Add Order</code> message that has been modified
Quantity	14	4	Binary	Instrument quantity associated with this complex order after this modify (may be less than the number entered)
Price	18	8	Binary Signed Long Price	The limit order price after this modify
Reserved	26	1	Bit Field	Reserved
Total Length = 27 bytes				

Modify (short)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x28	<code>Modify Order</code> Message (short)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	<i>Order Id</i> of a previously sent <code>Add Order</code> message that has been modified
Quantity	14	2	Binary	Instrument quantity associated with this complex order after this modify (may be less than the number entered)
Price	16	2	Binary Signed Short Price	The limit order price after this modify
Reserved	18	1	Bit Field	Reserved
Total Length = 19 bytes				

3.5.5 Delete Order

The `Delete Order` message is sent whenever an open complex order is completely canceled. The *Order Id* refers to the *Order Id* of the original `Add Order` message.

Delete				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x29	<code>Delete Order</code> Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	<i>Order Id</i> of a previously sent <code>Add Order</code> message that has completely cancelled
Total Length = 14 bytes				

3.6 Trade

The Trade message provides information about executions of complex order auctions on the Cboe complex book. Trade messages are necessary to calculate Cboe execution-based data. Trade messages do not alter the complex book and can be ignored if messages are being used solely to build a complex book.

No Add Order message is sent for complex auction orders, and thus, no order modification messages may be sent when complex auctions are executed. Instead, a Trade message is sent whenever a complex auction is executed in whole or in part. A complete view of all Cboe complex executions can be built by combining all Order Executed messages and Trade messages.

Trade (long)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x2A	Trade Message (long)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	<i>Order Id</i> of the executed order.
Side Indicator	14	1	Alphanumeric	Always "B" = Buy Order regardless of resting side
Quantity	15	4	Binary	Instrument quantity traded
Complex Instrument Id	19	6	Printable ASCII	<i>Complex Instrument Id</i> right padded with spaces.
Price	25	8	Binary Signed Long Price	The execution price of the order
Execution Id	33	8	Binary	Cboe generated day-unique execution identifier of this trade. <i>Execution Id</i> is also referenced in the Trade Break message.
Total Length = 41 bytes				

Trade (short)				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x2B	Trade Message (short)
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Order Id	6	8	Binary	<i>Order Id</i> of the executed order.
Side Indicator	14	1	Alphanumeric	Always "B" = Buy Order regardless of resting side
Quantity	15	2	Binary	Instrument quantity traded
Complex Instrument Id	17	6	Printable ASCII	<i>Complex Instrument Id</i> right padded with spaces.
Price	23	2	Binary Signed Short Price	The execution price of the order

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Execution Id	25	8	Binary	Cboe generated day-unique execution identifier of this trade. <i>Execution Id</i> is also referenced in the <i>Trade Break</i> message.
Total Length = 33 bytes				

3.7 Trade Break

The *Trade Break* message is sent whenever a complex execution on Cboe is broken. Trade breaks are rare and only affect applications that rely upon Cboe execution-based data. Applications that simply build a Cboe complex book can ignore *Trade Break* messages.

Trade Break				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x2C	<i>Trade Break</i> Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Execution Id	6	8	Binary	Cboe execution identifier of the execution that was broken. <i>Execution Id</i> refers to previously sent <i>Order Executed</i> or <i>Trade</i> message.
Total Length = 14 bytes				

3.8 Trading Status

The *Trading Status* message is used to indicate the current trading status of a complex instrument. A *Trading Status* message will be sent whenever a complex instrument trading status changes.

A *Trading Status* message will be sent for all complex instruments where the underlying security is Halted, Trading or Quoting.

Trading Status of “S” is to be implied at system startup for all series. Starting at 7:30AM ET, Cboe will send a *Trading Status* of “Q” once orders can be accepted for queuing in preparation for the market open. Sometime after 9:30AM ET, Cboe will send a *Trading Status* of “T” as series are open for trading on the Cboe platform. Note *Trading Status* of “Q” can also be explicitly disseminated during a Regulatory Halt Quoting Period.

A *Trading Status* message will also be sent:

- for a Regulatory Halt “Q”oting Period in any series where the underlying has experienced a Regulatory Halt as well as the “T”rading resumption for the same series.
- in the event of an Exchange specific “S”uspension.
- for instruments that are in a “Q”oting period for auctions.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Trading Status				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field
Message Type	1	1	0x31	Trading Status message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp
Complex Instrument Id	6	8	Printable ASCII	<i>Complex Instrument Id</i> right padded with spaces.
Trading Status	14	1	Alpha	“H” = Halted “Q” = Quote-Only “S” = Exchange Specific Suspension “T” = Trading
Reserved	15	3	Alpha	Reserved
Total Length = 18 bytes				

3.9 Auction Update

Auction Update messages are used to disseminate price and size information during Opening and Re-Opening (halt) auctions for complex instruments. The Auction Update messages are sent every five seconds during an opening period. Refer to the [Cboe Options Complex Book Process](#) specification for more information.

The Auction Update message has the following format:

Auction Update				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field.
Message Type	1	1	0x95	Auction Update Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp.
Complex Instrument Id	6	8	Printable ASCII	<i>Complex Instrument Id</i> right padded with spaces.
Auction Type	14	1	Alphanumeric	"O" = Opening Auction "H" = Halt Auction
Reference Price	15	8	Binary Signed Long Price	BBO Collared auction price (see Cboe Options Complex Book Process).
Buy Quantity	23	4	Binary	Instrument quantity on buy side at the <i>Reference Price</i> .
Sell Quantity	27	4	Binary	Instrument quantity on sell side at the <i>Reference Price</i> .
Indicative Price	31	8	Binary Signed Long Price	Price at which the auction book and the continuous book would match.
Auction Only Price	39	8	Binary Signed Long Price	Price at which the auction book would match using only <i>Eligible Auction Orders</i> (see Cboe Options Complex Book Process).
Total Length = 47 bytes				

3.10 Auction Summary

Auction Summary messages are used to disseminate the results of an auction of a complex instrument. An Opening or Re-Opening Auction Summary message for each complex instrument is sent at the conclusion of its Opening or Re-Opening auction and represents Cboe opening price. Refer to the [Cboe Options Complex Book Process](#) specification for more information.

The Auction Summary message has the following format:

Auction Summary				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field.
Message Type	1	1	0x96	Auction Summary Message
Time offset	2	4	Binary	Nanosecond offset from last unit timestamp.
Complex Instrument Id	6	8	Printable ASCII	Complex Instrument Id right padded with spaces.
Auction Type	14	1	Alphanumeric	"O" = Opening Auction "H" = Halt Auction
Price	15	8	Binary Signed Long Price	Auction price
Quantity	23	4	Binary	Cumulative instrument quantity executed during the auction
Total Length = 27 bytes				

3.11 End of Session

The End of Session message is sent for each unit when the unit shuts down. No more sequenced messages will be delivered for this unit, but heartbeats from the unit may be received.

End of Session				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field
Message Type	1	1	0x2D	End of Session Message
Timestamp	2	4	Binary	Nanosecond offset from last unit timestamp
Total Length = 6 bytes				

4 Gap Request Proxy Messages

The following messages are used for initializing a TCP/IP connection to the Gap Request Proxy (“GRP”) and to request message retransmissions. Customers only need to implement the following messages if gap requests will be made. The following messages will not be delivered using multicast.

4.1 Login

The `Login` message is the first message sent to the GRP by a user’s process after the connection to the GRP is established. Failure to login before sending any other message type will result in the connection being dropped by the GRP.

Login				
Field	Offset	Length	Value/Type	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x01	Login Message
SessionSubId	2	4	Alphanumeric	<i>SessionSubId</i> supplied by Cboe
Username	6	4	Alphanumeric	<i>Username</i> supplied by Cboe
Filler	10	2	Alphanumeric	(space filled)
Password	12	10	Alphanumeric	<i>Password</i> supplied by Cboe
Total Length = 22 bytes				

4.2 Login Response

The `Login Response` message is sent by the GRP to a user’s process in response to a `Login` message. The status field is used to reflect an accepted login or the reason the session was not accepted. If login fails, the connection will be dropped after the `Login Response` message is sent.

Login Response				
Field	Offset	Length	Value/Type	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x02	Login Response Message
Status	2	1	Alphanumeric	Accepted or reason for reject
Total Length = 3 bytes				
Login Response - Status Codes				
‘A’	Login Accepted			
‘N’	Not authorized (Invalid Username/Password)			
‘B’	Session in use			
‘S’	Invalid Session			

4.3 Gap Request

The `Gap Request` message is used by a user’s process to request retransmission of a sequenced message (or messages) by one of Cboe’s gap servers.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

Gap Request				
Field	Offset	Length	Value/Type	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x03	Gap Request Message
Unit	2	1	Binary	<i>Unit</i> that the gap is requested for
Sequence	3	4	Binary	<i>Sequence</i> of first message (lowest sequence in range)
Count	7	2	Binary	<i>Count</i> of messages requested
Total Length = 9 bytes				

4.4 Gap Response

The Gap Response message is sent by the GRP in response to a Gap Request message. The *Unit* and *Sequence* fields will match the values supplied in the Gap Request message. A Gap Response message, with a Status of Accepted or reason for failure, will be sent for each Gap Request message received by the GRP.

Gap Response				
Field	Offset	Length	Value/Type	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x04	Gap Response Message
Unit	2	1	Binary	<i>Unit</i> the gap was requested for
Sequence	3	4	Binary	<i>Sequence</i> of first message in request
Count	7	2	Binary	<i>Count</i> of messages requested
Status	9	1	Alphanumeric	Accepted or reason for reject
Total Length = 10 bytes				
Gap Response - Status Codes				
'A'	Accepted			
'O'	Out of range (ahead of sequence or too far behind)			
'D'	Daily gap request allocation exhausted			
'M'	Minute gap request allocation exhausted			
'S'	Second gap request allocation exhausted			
'C'	Count request limit for one gap request exceeded			
'I'	Invalid Unit specified in request			
'U'	Unit is currently unavailable			

* - All non-'A' status codes should be interpreted as a reject.

5 Spin Messages

5.1 Login

The `Login` message is the first message sent to the Spin Server by a user's process after the connection to the Spin Server is established. Failure to login before sending any other message type will result in the connection being dropped by the Spin Server.

The format of the `Login` message for the Spin Server is identical to that of the GRP described previously in [Section 4.1](#).

5.2 Login Response

The `Login Response` message is sent by the Spin Server to a user's process in response to a `Login` message. The status field is used to reflect an accepted login or the reason the session was not accepted. If login fails, the connection will be dropped after the `Login Response` message is sent.

The format of the `Login Response` message for the Spin Server is identical to that of the GRP described previously in [Section 4.2](#).

5.3 Spin Image Available

The `Spin Image Available` message is sent once per second and indicates through what sequence number a spin is available.

Spin Image Available				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x80	<code>Spin Image Available</code> Message
Sequence	2	4	Binary	Spin is available which is current through this sequence number
Total Length = 6 bytes				

5.4 Spin Request

The `Spin Request` message is used by a user's process to request transmission of a spin of the unit's order book. Refer to [Section 1.6](#) for more complete details regarding *Sequence* specification as well as buffering requirements.

Spin Request				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	<i>Length</i> of this message including this field
Message Type	1	1	0x81	<code>Spin Request</code> Message
Sequence	2	4	Binary	Sequence number from a <code>Spin Image Available</code> message received by the customer

Total Length = 6 bytes

5.5 Spin Response

The Spin Response message is sent in response to a user's Spin Request message indicating whether a spin will be sent.

Spin Response				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field
Message Type	1	1	0x82	Spin Response Message
Sequence	2	4	Binary	Sequence number from a Spin Image Available message received by the customer
Order Count	6	4	Binary	Number of Add Order messages which will be contained in this spin
Status	10	1	Alphanumeric	Accepted or reason for reject
Total Length = 11 bytes				
Spin Response - Status Codes				
'A'	Accepted			
'O'	Out of Range (<i>Sequence</i> requested is greater than <i>Sequence</i> available by the next spin)			
'S'	Spin already in progress (only one spin can be running at a time)			

* - All non-'A' status codes should be interpreted as a reject.

5.6 Spin Finished

The Spin Finished message is sent to indicate that all messages for the spin requested have been sent. A Spin Finished message is only sent if a Spin Request was not rejected. Upon receipt of a Spin Finished message, any buffered multicast messages should be applied to the customer's copy of the book to make it current.

Spin Finished				
Field Name	Offset	Length	Type/(Value)	Description
Length	0	1	Binary	Length of this message including this field
Message Type	1	1	0x83	Spin Finished Message
Sequence	2	4	Binary	Sequence number from the Spin Request message
Total Length = 6 bytes				

5.7 Spin Server Usage Example

The following diagram (see next page) shows the exchange of messages over time between a customer and Cboe's Multicast PITCH feed and spin server. Note that while the example may seem to imply only Complex Instrument Definition, Time and Add Order messages would be sent on a spin, this is not the case. Trading Status and Auction Update messages may also be sent.

US Options Complex
Multicast PITCH Specification (Version 2.0.9)

At time 1, the customer has no state of the book and desires to become current. The customer caches the received Multicast PITCH messages (sequences 310172 and 310173) for later use. Since the customer has no book, they cannot yet be applied.

At time 5, the customer has successfully logged into the Spin Server and has cached another message, sequence 310174.

At time 7, the customer receives a `Spin Image Available` message which indicates that the spin server is capable of giving them a spin of all open orders as of sequence 310169. The customer does not have all messages cached after 310169 (they are missing 310170 and 310171), so this spin is not useful to the customer.

At time 10, the customer receives a `Spin Image Available` message which is useful since it would be a spin of all orders up to and including sequence 310175 and the customer has all messages after 310175 cached.

At time 11, the customer sends a `Spin Request` for all messages up to and including 310175 and continues to cache Multicast PITCH messages received.

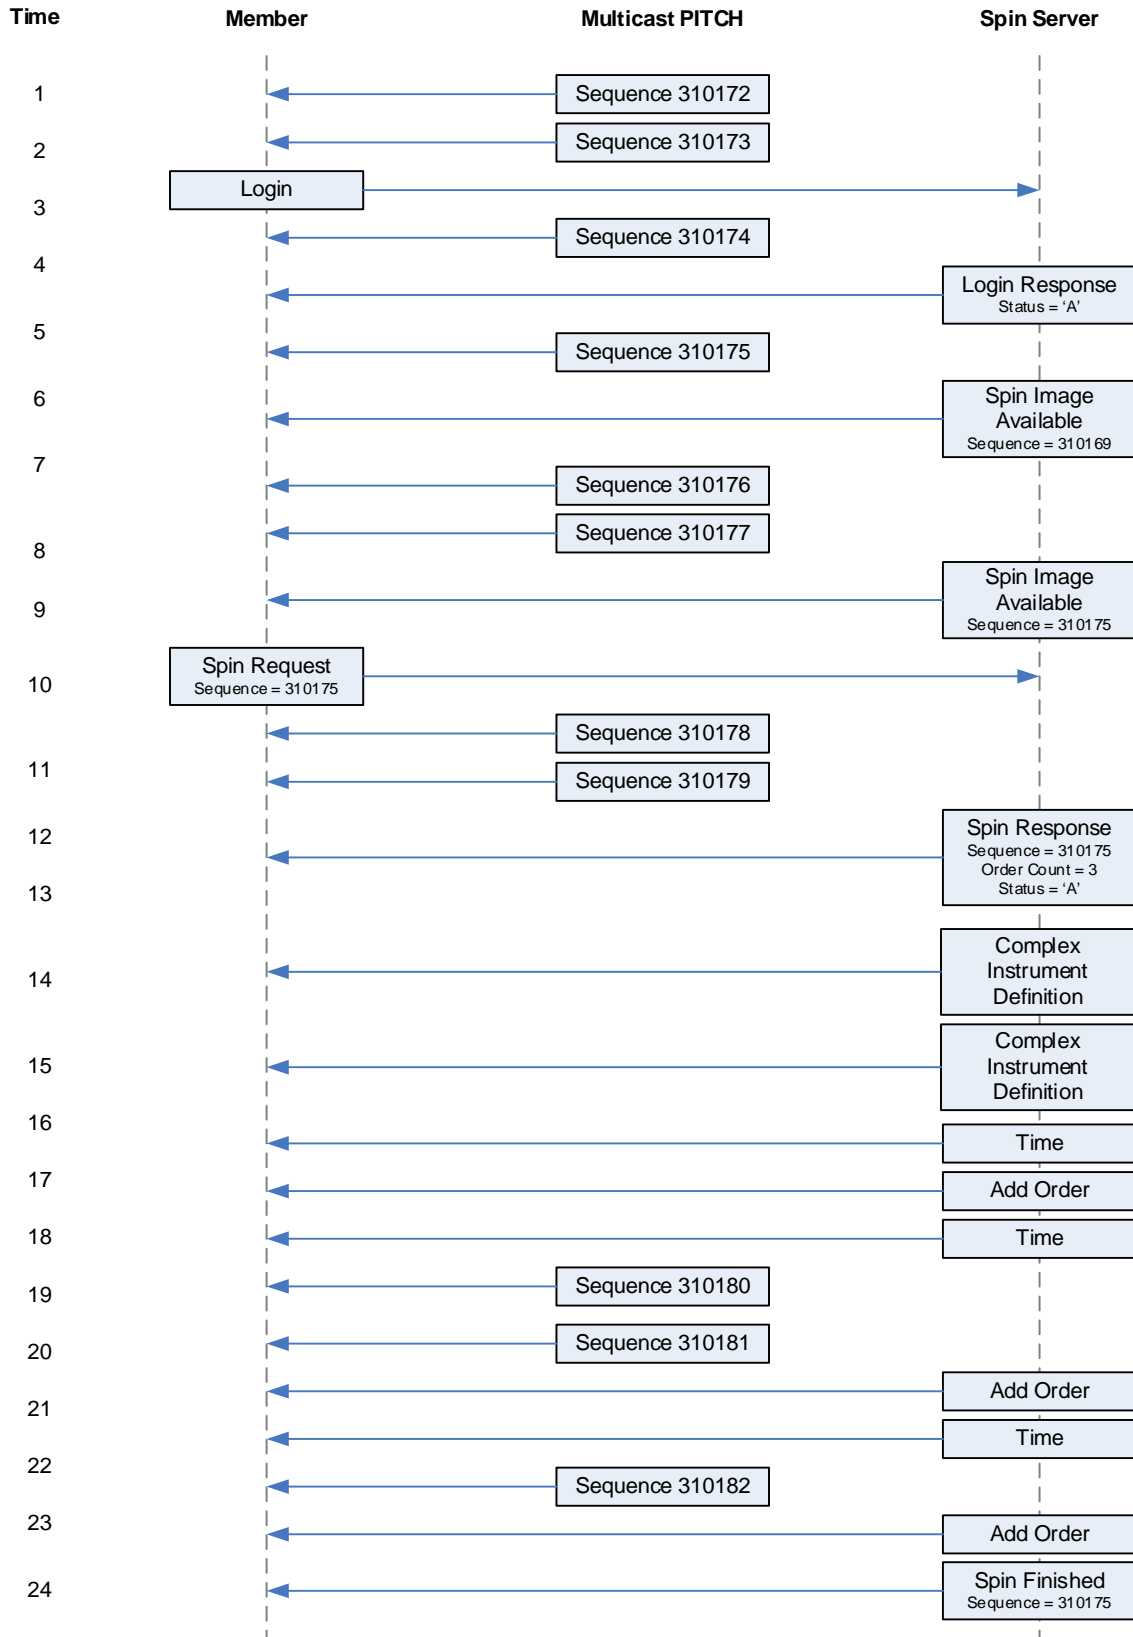

At time 14, the spin server acknowledges the spin request and indicates that five messages will be sent (complex instrument definition and open orders).

At time 24, the spin server indicates that it has finished sending all messages. The customer must then apply the cached messages from sequence number 310176 through current.

Notes:

- Spin Servers are available for each unit. Customers may need to employ multiple Spin Servers depending upon their architecture.
- As a rule of thumb, in its options markets Cboe typically has ~300,000 complex instruments defined and ~3.2 million open orders across all units, or an average of about 9,375 complex instruments and 100,000 open orders per unit. The actual number per unit varies depending upon activity in individual symbols. Expect this number to increase and plan accordingly.

8 Multicast Configuration

8.1 Production Environment Configuration

8.1.1 Limitations/Configurations

The following table defines Cboe current configuration for network and gap request limitations. These limitations are session based. Cboe reserves the right to adjust the gap request limitations to improve the effectiveness of the gap request infrastructure.

Period/Type	Limit/Setting	Notes
MTU	1500	Cboe will send UDP messages up to 1500 bytes. Customers should ensure that their infrastructure is configured accordingly.
Gig-Shaped Throttle	1 Gb/s	The real-time and gap multicast head ends are configured to shape their output to this level to minimize packet loss.
Gap Response Delay	2 ms	The Gap Server will delay resending sequenced messages via multicast for the specified limit in order to satisfy multiple GRP gap requests with one multicast response.
Count	100	Any single gap request may not be for more than this number of dropped messages.
1 Second	320 Requests	This is the maximum number of retransmission requests allowed per second for each session. This is renewed every clock second.
1 Minute	1500 Requests	This is the maximum number of retransmission requests allowed per minute for each session. This is renewed every clock minute.
Day	100,000 Requests	This is the maximum number of retransmission requests allowed per day for each session.
Within Range	1,000,000 Messages	Users' retransmission requests must be within this many messages of the most recent sequence sent by the real-time feed.

28	32278		
29	32279		
30	32280		
31	32281		
32	32282		
33	32283		

Note - Cboe reserves the right to add multicast addresses with prior notice, but no migration period. Notice will be given that the distribution will change on a certain date. Care should be taken to support mappings in these tables via software configuration.

9 Connectivity

9.1 Supported Extranet Carriers

Cboe has certified a number of carriers defined in the [Cboe US Equity/Options Connectivity Manual](#) with respect to redistribution of Cboe Multicast data feeds. For more information on receiving Multicast PITCH through any of these providers, reach out to the vendor contact noted in the Extranet Providers section of the Connectivity Manual.

9.2 Bandwidth Recommendation

The Gig-shaped feeds require 1Gbps of bandwidth. Cboe will use 90% of these respective bandwidths for Multicast PITCH to allow customers to use the same physical connection for FIX order entry if desired.

9.3 Multicast Test Program

The ZIP file located at http://www.batstrading.com/resources/membership/mcast_pitch.zip contains a sample program that may be used to test Multicast PITCH feed connections and to troubleshoot Multicast issues. Refer to the included README file for build and usage information.
